 What does a neuron compute 	1.	vvnat	aoes.	а	neuron	com	pute
--	----	-------	-------	---	--------	-----	------

1 / 1 point

- A neuron computes a linear function (z = Wx + b) followed by an activation function
- A neuron computes the mean of all features before applying the output to an activation function
- A neuron computes an activation function followed by a linear function (z = Wx + b)
- A neuron computes a function g that scales the input x linearly (Wx + b)

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

2. Which of these is the "Logistic Loss"?

1/1 point

- $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} \hat{y}^{(i)}|^2$
- $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} \hat{y}^{(i)}|$
- $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1 y^{(i)})\log(1 \hat{y}^{(i)}))$
- $\bigcirc \ \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} \hat{y}^{(i)})$

✓ Correct

Correct, this is the logistic loss you've seen in lecture!

3.	Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?	0 / 1 point
	x = img.reshape((3,32*32))	
	x = img.reshape((32*32,3))	
	x = img.reshape((32*32*3,1))	
	x = img.reshape((1,32*32,*3))	
	Incorrect	
4.	Consider the two following random arrays "a" and "b":	1/1 point
	1 a = np.random.randn(2, 3) # a.shape = (2, 3) 2 b = np.random.randn(2, 1) # b.shape = (2, 1) 3 c = a + b	
	What will be the shape of "c"?	
	c.shape = (2, 1)	
	c.shape = (2, 3)	
	The computation cannot happen because the sizes don't match. It's going to be "Error"!	
	c.shape = (3, 2)	
	Correct Yes! This is broadcasting, b (column vector) is copied 3 times so that it can be summed to each column of a.	

```
1 a = np.random.randn(4, 3) # a.shape = (4, 3)
2 b = np.random.randn(3, 2) # b.shape = (3, 2)
3 c = a*b
```

What will be the shape of "c"?

- c.shape = (3, 3)
- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- c.shape = (4, 3)
- c.shape = (4,2)

✓ Correct

Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

6. Suppose you have n_x input features per example. Recall that $X = [x^{(1)}x^{(2)}...x^{(m)}]$. What is the dimension

1 / 1 point

- (n_x, m)
- \bigcirc (1, m)
- \bigcirc (m,1)
- \bigcap (m, n_x)

✓ Correct

7. Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an elementwise multiplication.

1/1 point

Consider the two following random arrays "a" and "b":

```
1 a = np.random.randn(12288, 150) # a.shape = (12288, 150)
2 b = np.random.randn(150, 45) # b.shape = (150, 45)
3 c = np.dot(a,b)
```

What is the shape of c?

- c.shape = (150,150)
- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- c.shape = (12288, 150)
- c.shape = (12288, 45)

✓ Correct

Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because :

"number of columns of a = 150 = number of rows of b"

8. Consider the following code snippet:

0 / 1 point

```
1 # a.shape = (3,4)
2 # b.shape = (4,1)
```

How do you vectorize this?

- c = a + b.T
- c = a + b
- c = a.T + b.T
- C = a.T + b

Incorrect

9. Consider the following code:

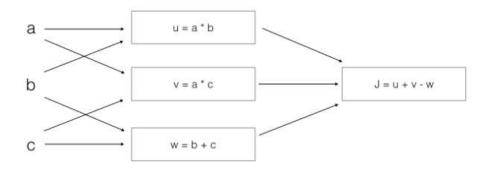

```
1/1 point
```

2	<pre>a = np.random.randn(3, 3) b = np.random.randn(3, 1) c = a*b</pre>	

What will be c? (If you're not sure, feel free to run this in python to find out).

- \odot This will invoke broadcasting, so b is copied three times to become (3,3), and \ast is an element-wise product so c.shape will be (3, 3)
- This will invoke broadcasting, so b is copied three times to become (3, 3), and * invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "*" to operate on these two matrices. You need to instead use np.dot(a,b)

What is the output J?

- $\int J = (c 1)*(b + a)$
- (a) J = (a 1) * (b + c)
- J = a*b + b*c + a*c
- J = (b 1) * (c + a)

/ Correct

 $\mbox{Yes. J} = \mbox{u} + \mbox{v} - \mbox{w} = \mbox{a*b} + \mbox{a*c} - (\mbox{b} + \mbox{c}) = \mbox{a*} (\mbox{b} + \mbox{c}) - (\mbox{b} + \mbox{c}) - (\mbox{b} + \mbox{c}) = (\mbox{a} - 1) * (\mbox{b} + \mbox{c}).$
